

WHAT IS CLAIMED IS:

1. A personal information terminal comprising:
 - a data display means including an enlarging optical system;
 - 5 an input means for receiving instructions from a user;
 - a radio communications means for connecting to a network; and
 - 10 a control means for obtaining information from the network through the radio means and displaying the information on the data display means, based on instructions from the input means.
2. A personal information terminal according to Claim 1, wherein the control means limits the electrical power supply to the data display means to an amount which is less than an amount at a normal time while the control means is obtaining the information from the network through the radio means.
- 20 3. A personal information terminal according to Claim 1, wherein the data display means is an ocular-type data device comprising of a prism, a liquid crystal display device and an illumination device.
- 25 4. A personal information terminal according to Claim 3, wherein the control means cuts off the

electrical power supply to the illumination device while the control means is obtaining the information from the network through the radio means.

5 5. A personal information terminal according to Claim 3, wherein the control means turns the liquid crystal display device onto a low energy consumption mode while the control means is obtaining the information from the network through the radio means.

10

6. A personal information terminal according to Claim 1, wherein the input means is a push button switch.

15

7. A personal information terminal comprising:

an ocular-type data display means arranged within a frame of a window and having an enlarging optical system;

20

an input means for receiving instructions from a user;

a radio communications means for connecting to a network;

a control means for obtaining information from the network through the radio means and making the information be displayed on the data display means, based on instructions from the input means; and

a notifying means for providing a notification to

a user at least as to whether the control means is in a state of obtaining information from the network through the radio means or not the notifying means being arranged outside the frame of the window.

5

8. A personal information terminal according to
Claim 7, wherein the notification means makes the
notification visually.

10

9. A personal information terminal according to
Claim 8, wherein the notification means comprises a
light emitting diode capable of emitting light of a
plurality of colors.

15

10. A personal information terminal according to
Claim 7, wherein the notification means makes the
notification auditorily.

20

11. A personal information terminal according to
Claim 10, wherein the notification means comprises a
speaker.

25

12. A personal information terminal according to
Claim 7, wherein the notification means provides
notification to the user as to whether the control
means is in a state of obtaining information from the
network through the radio means, or whether it is in a

state of displaying the obtained information on the data display means.

13. A personal information terminal according to
5 Claim 12, wherein the notification means further provides notifications to the user as to whether the radio means is in a state of having ended the network connection normally, or whether the radio means is in a state of having ended the network connection
10 abnormally.

14. A personal information terminal according to Claim 7, wherein the data display means is comprised of at least a liquid crystal display device and a prism having a substantially triangular column shape; and
15 wherein the notification means is located near the bottom surface of the substantially triangular column of the prism.

20 15. A personal information terminal according to Claim 1, wherein the input means is comprised of a moving means for moving a cursor position on a display screen of the data display means; and
wherein a starting means for starting a process
25 corresponding to information on the display screen where the cursor is located.

16. A personal information terminal according to
Claim 15, wherein the moving means is a means for
converting manipulation instructions from the user into
vector values on a two-dimensional plane surface, and
5 the starting means is a push button switch.

17. A personal information terminal according to
Claim 15, wherein the data display means is lodged
within a frame of a display window provided to a
10 housing of the personal information terminal, wherein
the moving means is arranged on a side of the personal
information terminal housing that the display window
frame is located on, and wherein the starting means is
arranged on a side opposite from the side that the
15 display window frame is located on.

18. A personal information terminal according to
Claim 17, wherein a curved groove is provided to the
side of the personal information terminal housing that
20 is opposite from the side that the display window frame
is located on, and the starting means is arranged in
this groove.

19. A personal information terminal according to
25 Claim 15, wherein the data display means is arranged
within the frame of the window provided to the housing
of the personal information terminal, wherein the

starting means is arranged on the side of the personal information terminal housing that the display window frame is located on, and wherein the moving means is arranged on the side opposite from the side that the display window frame is located on.

20. A personal information terminal according to Claim 19, wherein a curved groove is provided to the side of the personal information terminal housing that is opposite from the side that the display window frame is located on, and the moving means is arranged in this groove.

21. A personal information terminal according to Claim 1, wherein the data display means is arranged within a frame of a display window provided to a housing of the personal information terminal, and the input means is provided on the personal information terminal housing, and a surface of the display window and a surface of the housing where the input means is arranged are parallel.

22. A personal information terminal according to Claim 21, wherein a predetermined distance exists between the housing surface where the display window is provided and the housing surface where the input means is provided.

23. A personal information terminal according to
Claim 22, wherein the predetermined distance is at
least the size of a thumb.

5 24. A personal information terminal according to
Claim 1, wherein the data display means is arranged
within a frame of a display window provided to a
housing of the personal information terminal, and an
area around the display window frame is black.

10

25. A personal information terminal according to
Claim 7, wherein the window frame is provided to a
housing of the personal information terminal, and the
notification means is arranged either on a surface of
the housing where the window frame is provided, or on a
surface of the housing that is perpendicular to the
housing surface where the window is provided.

15 26. An energy-consumption reduction method to be
applied in a personal information terminal having a
data display means including an enlarging optical
system, an input means for receiving instructions from
a user and a radio communications means for connecting
to a network, the method comprising:

20 an information obtaining step of obtaining
information from the network through the radio means
based on instructions from the input means;

a display step of displaying the information obtained in the information obtaining step on the data display means; and

5 a limiting step of limiting an amount of the electrical power supply to the data display means while the information is being obtained from the network through the radio means at the information obtaining step, the amount being less than an amount at a normal time.

10

27. An energy-consumption reduction method according to Claim 26, wherein the data display means is comprised of a prism, a liquid crystal display device and an illumination device; and

15

wherein the electrical power supply to the illumination means is cut off in the limiting step while the information is being obtained from the network through the radio means at the information obtaining step.

20

28. An energy-consumption reduction method according to Claim 26, wherein the data display means is comprised of a prism, a liquid crystal display device and an illumination device; and

25

wherein the liquid crystal display is turned onto a low energy consumption mode in the limiting step while the information is being obtained from the

TELEGRAM - 022011660

network through the radio means at the information obtaining step.

29. A status notification method to be applied in

5 a personal information terminal having an ocular-type data display means arranged within a frame of a window and having an enlarging optical system, an input means for receiving instructions from a user, a radio communications means for connecting to a network and a 10 notifying means arranged outside the frame of the window, comprising of:

an information obtaining step obtaining information from the network through the radio means based on instructions from the input means;

15 a display step of displaying the information obtained in the obtaining step on the data display means; and

a notifying step of providing a notification to a user at least as to whether information is being 20 obtained from the network through the radio means or not by means of a notification means.

30. A status notification method according to

Claim 29, wherein in the notification step the 25 notification means provides notification to the user as to whether the information is being obtained from the network through the radio means at the information

obtaining step, or whether the information is being displayed on the data display means at the display step.

5 31. A status notification method according to
Claim 30, wherein, in the notification step, the
notification means further provides notification to the
user as to whether the radio means is in a state of
having ended the network connection normally, or
10 whether the radio means is in a state of having ended
the network connection abnormally.

15 32. A computer readable recording medium storing
as a program an energy-consumption reduction method to
be applied in a personal information terminal having a
data display means equipped with an enlarging optical
system, an input means for receiving instructions from
a user and a radio communications means for connecting
to a network, the energy-consumption reduction method
20 comprising:

an information obtaining step of obtaining
information from the network through the radio means
based on instructions from the input means;
a display step of displaying the information
25 obtained in the information obtaining step on the data
display means; and
a limiting step of limiting an amount of the

electrical power supply to the data display means while
the information is being obtained from the network
through the radio means at the information obtaining
step, the amount being less than an amount at a normal
time.

5

33. A recording medium according to Claim 32,
wherein the data display means is comprised of a prism,
a liquid crystal display device and an illumination
10 device; and

wherein the electrical power supply to the
illumination means is cut off in the limiting step
while the information is being obtained from the
network through the radio means at the information
15 obtaining step.

15

34. An recording medium according to Claim 32,
wherein the data display means is comprised of a prism,
a liquid crystal display device and an illumination
20 device; and

wherein the liquid crystal display device is
turned onto a low energy consumption mode in the
limiting step while the information is being obtained
from the network through the radio means at the
25 information obtaining step.

25

35. A computer readable recording medium storing

TECHNICAL INFORMATION

as a program a status notification method to be applied
in a personal information terminal having an ocular-
type data display means arranged within a frame of a
window and having an enlarging optical system, an input
means for receiving instructions from a user, a radio
communications means for connecting to a network and a
notifying means arranged outside the frame of the
window, the status notification method comprising:

an information obtaining step of obtaining
information from the network through the radio means
based on instructions from the input means;

a display step of displaying the information
obtained in the information obtaining step on the data
display means; and

15 a notifying step of providing a notification to a
user at least as to whether the information is being
obtained from the network through the radio means or
not by means of a notification means.

20 36. A recording medium according to Claim 35,
wherein in the notification step the notification means
provides notification to the user as to whether the
information is being obtained from the network through
the radio means at the information obtaining step, or
25 whether the information is being displayed on the data
display means at the display step.

37. A recording medium according to Claim 36,
wherein in the notification step the notification means
further provides notification to the user as to whether
the radio means is in a state of having ended the
5 network connection normally, or whether the radio means
is in a state of having ended the network connection
abnormally.
